

The patented V drinker from Arato: The intelligent solution for wean to finish

Arato
Quality Drinkers since 1908

+ + New + + New + + New + + New + + New + + New + +

V-Drinker

There's also a positive side-effect (particularly for the environment!): less slurry.

Optimised efficiency in livestock farming

The figures speak for themselves: Experiments with the innovative drinkers showed a 15.5 per cent daily gain in the animals and up to 7.2 per cent greater feed conversion than with conventional equipment. At the same time, water losses were down by 56 per cent.

Convincing price-performance ratio

With the V drinker from Arato, you get an outstanding product at a favourable price. That's because the drinker can do so much more than conventional drinkers – but without costing any more. The Arato V drinker is an investment that pays off – for you and your animals!

Hygienic, efficient, boosts yields

Four words that put the advantages of the intelligent **Arato V drinker** in a nutshell – and sum up what distinguishes this innovative product from conventional drinkers. The benefit to you is clear: less work and lower costs coupled with better performance from your animals.

Clean water for healthy animals

You know the problem: conventional nipple drinkers are either too high or too low, they require complicated readjustment from you and waste a lot of water. With drinker basins and flooders, no height adjustment is necessary, but the water is generally contaminated with excrement, urine or fodder, which naturally has a negative effect on the performance and health of your animals.

V-Double Drinker

The V drinker from Arato: greater hygiene for a greater yield

It's a very different story with the intelligent V double drinker from the old-established firm of Arato: the drinker's intelligent mechanism combines reducing the workload and raising economic efficiency with the enhanced well-being of and greater performance from your animals. The reason: the V drinker is already easily accessible to pigs from the 17th day of life onwards and provides them with a constant supply of fresh, clean water. At the same time, the V drinker with its patented mechanism functions extremely efficiently and saves water because the flow of water is interrupted while the animals swallow.

V-Triple Drinker

Benefits of the product at a glance:

- no more height adjustments necessary
- low cost thanks to excellent price-performance ratio
- saves water with the patented sws (stop-while-swallow)-mechanism
- ideal accessibility for all animals from the 17th day of life onwards
- raises performance thanks to improved hygiene
- long-lasting and ecologically sound
- greater well-being for the animals
